Hill Training

I alternate hill training with tempo runs and interval training mainly to provide some variety in training. Even though the CIM has a flat course, hill repeats can be an important part of training, because running hills will strengthen quadriceps muscles. Also, there is less impact running up a hill than running fast on the flat.

Best choice would be to substitute hill repeats for some, if not all, of the interval workouts and/or do tempo runs over a hilly course. The speed benefits of hill training are similar to those for interval training on the track. Olympic champion Frank Shorter refers to hill training as, "interval training in disguise."

We have selected hills about a quarter-mile long, but don't worry about the pitch or the exact distance.

Interval Training

In training for a marathon, long repeats (800, 1600, or even longer) generally work better than short repeats (200, 400). We will use 800 repeats for this program.

Run an 800 at faster-than-marathon pace, rest by jogging and/or walking 400, then start again. Further instructions are included in the weekly screens, but we will use "Yasso Repeats" and FARTLIKS.

Yasso suggests running '800 Repeats' using the same numbers as your marathon time. In other words, if you run a three-hour marathon, you do the 800s in three minutes. A 3:10 marathoner does 3:10 repeats; 3:20 marathoner, 3:20 repeats, etc. It seems silly, but it works.

Tempo Runs

A tempo run is a continuous run with a buildup in the middle to *near* 10-K race pace. Notice I said "near" 10-K race pace. Coach Jack Daniels defines the peak pace for tempo runs at the pace you might run if racing flat-out for about an hour. That's fairly fast, particularly if the tempo run is 45 minutes long, but you're only going to be near peak pace for 3-6 minutes in the middle of the run.

A tempo run of 30 to 40 minutes would begin with 10-15 minutes easy running, build to peak speed during the next 10-20 minutes, then finish with 5-10 minutes easy running.
